

Dr Greenthumbs Product Spotlight

FRUIT ROIDS

1. What is Fruit Roids and what does it do?

Fruit Roids is a highly regarded flower growth enhancer composed of 100% organic and soil-friendly ingredients. It's formulated to provide flowering plants with a comprehensive range of organic minerals, amino acids, growth hormones, and enzymes. These components are precisely targeted to unlock the plants' true growth potential, resulting in increased yields, oil production, and improved overall plant health.

2. How does Fruit Roids enhance plant growth and resistance?

Fruit Roids activates the plants' inherent defense mechanisms through its balanced levels of salicylic acid, chitosan, and phytohormones. This enhances hormone signaling, leading to greater resistance against mold and pest attacks. The product also thickens plant cell walls, contributing to sturdier stems, bigger leaves, and improved resilience.

3. How does Fruit Roids stimulate flowering and root growth?

Fruit Roids contains organic and plant-based growth hormones like Cytokinin and Gibberellin. These hormones stimulate root growth, secondary branching (more bud sites), and ultimately lead to increased flower production. The product's complex carbohydrates also aid nutrient transportation and support root zone microbial life.

4. How is Fruit Roids different from other products?

Fruit Roids is an all-in-one solution that eliminates the need for multiple individual products such as silica, seaweed, enzymes, and natural plant growth regulators. This simplifies the growing process and saves growers both time and money.

5. How should Fruit Roids be used?

Mixing and Application: Mix Fruit Roids vigorously before use and maintain agitation during application. It can be added to compost tea or used as a foliar solution. For optimal results, use it 3 or 4 days apart from your weekly Root Roids dose.

Sick & Unhealthy Plants: Apply 1/4 to 1/2 teaspoon per liter of water, two times with a 7-day interval. For best results, use in combination with Root Roids.

Vegetative Growth: Use 1/2 teaspoon per liter of water 7 days before the end of the vegetative growth stage.

Flowering Growth: Use 1/2 to 1 teaspoon per liter of water during the flowering stage.

Growing in Coco: Continue using Fruit Roids until your flush period. Add it to your tank before pH adjusting your water.

Growing in Soil: Use Fruit Roids until the last week of the flowering stage.

Hydroponic Consideration: Hand water the product, ensuring maximum efficiency and uptake by plants. If using irrigation, follow specific recommendations to ensure proper application.

6. What are the main ingredients in Fruit Roids?

Fruit Roids contains a proprietary blend of 100% natural enzymes, plant-based growth hormones, minerals, amino acids, and complex carbohydrates.

7. Can Fruit Roids be combined with other flowering and PK products?

Yes absolutely! Customers see amazing results utilizing Fruit Roids with their existing Flower Boosting regime. It is advised to drop your additive EC levels in half when applying Fruit Roids. Do not measure the EC/PPM of Fruit Roids as you will not get an accurate reading.
